PREFACE

THIS book has been compiled, primarily, to satisfy a demand for a book of recipes conveniently arranged for use of teachers and students in technical schools. It is hoped that it may prove valuable also to all others who are interested in the preparation of food. For this reason, a number of distinctive features characterize the book, as a résumé on Foods, in which is given a brief explanation of terms such as are met in many of the popular articles of newspapers and magazines, and following this, practical suggestions as to principles underlying the planning of diets and menus.

The recipes offered have been carefully tested for use in school and home; whenever possible, temperatures used in cooking have been stated. In cases which allow of such, a tabulated form has been used, as, for example, the tables which enumerate Cuts of Meat, Sauces for Meats and Vegetables. It is believed that this method will prove to be of great convenience to those using the book.

Because of the close relation between health and careful food preparation, the authors express the earnest hope that this book may stimulate a keener interest in improved food standards in the home.

CHAPTER I

FOOD AND ITS USE.

A.—THE ESSENTIALS OF AN ADEQUATE DIET.

The well-being and success in life of every individual bear a closer relation to food than to any other single factor known. Sleep, fresh air and exercise are absolute essentials to health, but these are not capable, singly or combined, of outweighing for any time the ill-effects which eventually follow a wrong use of food.

Many diseases known to medical science are directly traceable to an inadequate or faulty diet; a low physical condition, not amounting to actual disease, but sufficient to seriously endanger the health of the individual, is too often the direct result of a lack of knowledge or a disregard of the importance of food. As living conditions become greatly changed and the strain of modern life grows more intense, those factors which contribute to health should expand in importance and value. Unfortunately, in many instances, such is not the case, and a tremendous loss of valuable time and energy goes hand in hand with a discouraging struggle against ill-health.

A misguided appetite, an unsound fad or a colorful advertisement should have no part in determining so vital a problem.

The term "Food" applies to any substance which contains one or more of the essentials for the maintenance of the functions of the body—for the growth and repair of tissues, the regulation of temperature, the performance of work by the various organs and tissues. These essential

factors which must enter into the constitution of every adequate diet are:

1. Water.
2. Carbohydrates (sugars and starches).
3. Proteins.
4. Fats and lipoids.
5. Mineral salts.
6. Vitamins.
7. Roughage.

I. Water enters into body composition to the extent of approximately two-thirds of its weight. A daily loss of water necessitates a daily replenishing of about two quarts for an adult; of this amount, about two-thirds is contained in solid foods. An abundant use of water is necessary to a healthy condition.

II. Carbohydrates, which include the many sugars and starches, are compounds of carbon, hydrogen and oxygen. To a great extent they meet the heat and energy requirement of the body. The chief sources of carbohydrates are:

- | | | |
|---------------------------------------|---|---|
| A. Cereals. | { | Wheat and wheat products.
Corn and corn products.
Rice, oats, barley, rye and their products.
Tapioca, sago. |
| B. Sweet Foods. | { | Sugar and sugar products.
Honey.
Sweet fruits.
Preserves, jams and jellies. |
| C. Sweet and starchy vegetables. | { | Potatoes, Irish and sweet.
Carrots, parsnips and other root vegetables.
Corn.
Dried legumes. |

In many diets, carbohydrate foods are too freely used; their over-use becomes a danger when white bread, cakes, pastry, sugar and candy are the almost exclusive sources of carbohydrates.

III. Proteins are nitrogen-containing compounds, and are necessary for the constitution of the various proteins in the tissues and fluids of the body. While they also serve as sources of heat and energy, their chief function is that of

building. They are composed of nitrogen, carbon, hydrogen, oxygen, sulphur, and in some cases phosphorus and iron. Since they vary in their completeness as to the elements necessary for body-protein building, they are graded as shown below.

The chief sources of proteins are:

- | | | |
|--|---|--|
| A. Complete proteins (adequate for building body proteins)..... | { | Milk.
Cheese.
Eggs.
Muscle of beef, veal, lamb, pork,
poultry, fish, shellfish.
Nuts. |
| B. Less complete proteins (not adequate alone for building body proteins)..... | { | Wheat.
Corn. |
| C. Incomplete proteins. (Require to be supplemented from grade A.) | { | Other cereals than wheat and corn,
legumes (peas, beans, lentils). |
| D. Protein-sparer; not a builder of body proteins.... | { | Gelatine. |

Of all the protein foods, milk is of greatest importance because of the character of its proteins and its richness in other essential food materials. This is true especially in regard to diets for children.

IV. Fats and Lipoids are compounds of carbon, hydrogen and oxygen; lipoids differ from the fats proper, in that they contain a nitrogen or nitrogen and phosphorus radicle, making them of special value in growth processes—these are such as fats in milk, egg yolk, nerve and brain tissues.

Fats are sources of heat and energy and are much more concentrated in fuel material than the carbohydrates and proteins; they are stored as fatty tissue in the body where they may serve as a reserve fuel supply, and also act, as an insulating medium, in the regulation of temperature.

The chief sources of fats are:

- | | | |
|------------------|---|---|
| A. Animal fats.. | { | Milk, cream, butter, cheese.
Meat fat—beef, lamb, pork, etc. |
|------------------|---|---|

- B. Vegetable fats { Nuts, nut oils.
Germ of grains (cereal oils—as corn oil).
Olive oil, cocoanut oil.

V. Mineral Salts are the compounds of a number of mineral elements which enter into body composition; of the elements, those which require special consideration in matters relating to diet are iron, calcium and phosphorus; an adequate supply of these from foods is considered to be a safe guarantee of the requirement of others, as magnesium, potassium, etc. Sodium is added to foods as sodium chloride (salt) for flavoring; in some special cases, the iodine requirement is not met in the ordinary diet.

The chief sources of mineral matter are:

- A. Vegetable foods... { Leaf and stalk vegetables.
Root vegetables (mostly in a layer near the surface).
Whole grains and cereals.
- B. Fruits.
- C. Milk, which is a most valuable source of lime and phosphorus and is therefore of prime importance in diets for children.
- D. Meats—the juice of red meats furnishes considerable iron, which is lacking in milk.

Modern manufacturing processes (used in the preparation of such foods as cereals, of which a large proportion of the average diet is composed), result in a considerable lessening of the mineral content by the removal of the germ and bran; therefore an adequate diet contains an abundance of those other foods which may replenish that loss—such foods as milk, fruits, leaf vegetables.

VI. Vitamins are the subject of extensive investigation and, up to the present time, are better known because of their absence than their presence. A diet may be adequate in all other respects, but, because of a lack of vitamins may be the cause of one of a number of “deficiency diseases.” Very little is known of their composition, but research workers have given us much valuable data as to the foods which may be termed “*protective foods*” because of their vitamin content.

The chief sources of vitamins are:

Vitamin A.

- | | | |
|---|---|---|
| 1. Soluble in fat of the food. | { | Milk, butter, cream. |
| 2. Necessary for growth and development. | | Egg yolk. |
| 3. Lack of this vitamin results in malnutrition, rickets, diseased condition of the eyes. | | Fat of liver and kidneys (cod liver oil). |
| | | Germ of cereals. |
| | | Tomatoes, carrots, sweet potatoes. |
| | | Yellow corn, oranges. |
| | | Leafy vegetables (very little). |

Vitamin B.

- | | | |
|---|---|--|
| 1. Soluble in water of the food. | { | Plant foods, especially of the leaf and stalk variety, as cabbage, lettuce, spinach. |
| 2. Necessary for growth and development. | | Root vegetables. |
| 3. Improves the appetite. | | Fruits. |
| 4. Increases assimilation of food. | | Germ and bran of cereals. |
| 5. Lack of this vitamin results in under development, low resistance, low functioning powers. | | Milk. |
| | | Yeast. |

Vitamin C.

- | | | |
|--|---|--|
| 1. Soluble in water of food. | { | Fruits, especially oranges and tomatoes. |
| 2. Necessary to a healthy condition. | | Vegetables, especially green vegetables. |
| 3. A continued lack of this vitamin results in scurvy. | | Raw milk. |

A diet which includes liberal amounts of milk, fresh vegetables and fruits, admits of very little danger of "deficiency diseases," but when fine cereal foods and much meat form a large part of the diet, the problem is sure to arise in one of its many forms. While the effect of long storing and long cooking of foods (as in canning) varies, it should be remembered that in many cases the tendency is to reduce the vitamin content of the food and therefore to lessen its efficiency. It is a wise rule to follow that some fresh, uncooked food—fruit or vegetable—be eaten every day.

VII. Roughage refers to the insoluble and therefore indigestible part of certain foods. This material, which exists in all vegetable foods in their natural condition, forms the framework and covering of the various parts. Here, again, modern methods of preparation reduce the natural value of foods by the removal, in part or entirely, of those substances which stimulate the movements of the digestive tract and therefore help to keep it in a healthy condition.

The chief sources of roughage are:

Vegetable foods.	{	Leaf and stalk vegetables—fibrous framework.
		Root vegetables—fibrous material throughout and outer skin.
		Cereals—bran covering.
		Fruits—fibrous framework and skin.

Summary.

A study of the facts which have been enumerated emphasizes the importance of a diet which contains

1. foods in their natural state—fruits, vegetables and cereals.

2. a liberal use of milk and eggs—meat is not of equal importance.

3. plenty of water.

B.—PRINCIPLES UNDERLYING THE PLANNING OF DIETS.

I. Buying of Food.

Since, at the present time, the largest expenditure of the income is for food, a safe and satisfactory return, in terms of health for money spent, can be hoped for only when a proper distribution is made. The following apportionment may serve as a guide:

TABLE I.—FOOD BUDGET.

Percentage of money allowed for food	Kind of food purchased.	Distribution.
About 25 to 30...	Sweet foods.	Sugar, candy, etc., 4 to 8%. Breads, cakes, cereals, 12 to 15%. Vegetables, 4 to 8%.
About 15 to 20...	Cereals and cereal products.	
About 20 to 25...	Starchy vegetables.	
	Leafy vegetables.	
	Fruits.	Meats and fish, 10 to 15%. Eggs, 5 to 7%. Cheese and nuts 3 to 5%.
	Milk.	
	Butter.	
	Cream.	
About 20 to 25...	Meat.	Meats and fish, 10 to 15%. Eggs, 5 to 7%. Cheese and nuts 3 to 5%.
	Meat substitutes, as eggs, cheese, nuts.	
About 5 to 10....	Fats and oils.	
	Condiments.	

How to Practise Economy.

1. Use milk freely. One quart of milk for each child and one-third to one-half as much for each adult, is an economical expenditure.

2. Use meat sparingly. For the average person, meat once a day is quite sufficient and all that is wise. Learn to use cheap cuts of meat which equal and sometimes exceed more expensive cuts in the amount of nutriment provided.

3. Use meat substitutes. Milk is always a cheap substitute; cheese and nuts may be used to advantage; eggs, when not too expensive.

4 Use plenty of fruits and vegetables. Tomatoes (fresh or canned) and cabbage (of the leafy vegetables) are among the *protective* foods and are cheap enough to be a profitable purchase at any season, and therefore available to all.

5. Use bread and other cereal foods freely. These are the cheapest sources of energy, but their use should not exclude vegetables and fruits; (bread is not a complete substitute for potatoes).

Mistakes in the purchase of food are made when

1. much money is spent on cakes, pastry, jellies, jams, candy and high-priced ready-to-serve foods.
2. foods are bought out of season.
3. expensive cuts of meat are used.

II. Selection of Food.

The selection and preparation of foods should be considered one of the most important duties one may be called upon to perform—a duty which should not be assumed without an intelligent understanding of those principles which make for health and physical well-being.

1. Make the “protective” foods (milk, fruits and vegetables) the basis around which other foods are grouped; select foods from each group as given in Table III.

2. Include some laxative foods in every meal—foods containing roughage, fat or oil, vegetable acids.

3. Include some hard food in every meal, in order to exercise the teeth. Exercise, in all cases, increases circulation and a more complete distribution of the nutrients of food. Mastication of crisp, firm food plays an important part in the formation of teeth of good structure and enduring qualities.

4. Select foods suitable to the season of the year, the age of those being served, and the work which is carried on.

Mistakes are made when

1. time is spent in the preparation of elaborate dishes, except for occasional serving.

2. over-rich food is used.

3. too great a variety is included in a single meal; simple meals are much more easy of digestion than those which are complex.

Variety may be achieved by

(a) using a variety of foods from day to day and from week to week.

(b) preparing an amount sufficient for the meal in order to avoid many "left-overs."

(c) preparing foods in different ways—for example, potatoes and apples admit of a great variety of methods of preparation, with very little difference in time and material required.

(d) making use of foods when in season.

(e) developing the natural flavor of the food rather than depending upon added flavorings, as spices, which with continued use become tiresome and uninteresting.

III. Quantity of Food.

A. The amount of food required depends upon age, size, sex, climate, energy expenditure and condition of health. The quantity of food necessary for a child provides sufficiently for normal growth and a healthy physical condition; for an adult, the food required is adequate in maintaining normal weight under existing conditions as to work, climate, etc. The appetite cannot be followed as a safe guide—over-eating is very frequently a dangerous habit; under-eating may be accompanied by as great a risk.

The following table shows briefly the normal food requirements:

TABLE II.—DAILY FOOD REQUIREMENTS.

Individual.	Weight.	Activity.	Requirements in Calories.
Man.....	150 lbs.	Moderately active work.	2500 to 3200
		Sedentary work.	2200 to 2800
Woman....	130 lbs.	Moderately active work.	2200 to 2500
		Sedentary work.	2000 to 2200
Children...	Ages.		
	1 to 2 years.		1000 to 1200
	2 to 5 years.		1200 to 1500
	6 to 9 years.		1400 to 2000
	10 to 13 years.	Boys, 2300 to 3000	Girls, 1800 to 2400
	14 to 17 years.	Boys, 2800 to 3400	Girls, 2200 to 2600

(Note the requirement of growing children as compared with adults at moderately active work).

B. A diet may be considered as well-balanced when about 10 to 12 per cent. of the total energy requirement is provided by protein. The following table may serve as a help in the selection of foods:

TABLE III.—DIET PLAN.

Percentage of Food Requirement.	General Source.	Specific Foods.
10 to 15...	Foods rich in sugar.	Sugar, syrups, candy, jelly, preserves, dried fruits, sweet cakes.
30 to 40...	Foods rich in starch.	Cereals and cereal products (including flour mixtures), starchy vegetables, tapioca, sago.
10 to 15...	Foods rich in fat.	Fat meats, lard, oils, butter, cream, cheese, egg yolks ($\frac{1}{3}$ fat), nuts.
25.....	Foods rich in protein.	Milk, cheese, eggs, nuts, legumes, lean meats, fish, poultry.

(Note—only one-third of the total protein of the diet should be provided by flesh food.)

Mistakes are made when

1. too much sugar is used. Sugar is the purest form of carbohydrate; it is heat and energy producing, but has no value in body building, being entirely free from protein and the so-much-needed mineral salts. A large amount of sugar reduces the appetite for other foods and therefore interferes greatly with the possibilities of an adequate diet.

2. too much starch is used. Women, perhaps more than men, tend to choose largely from starchy foods in the form of flour mixtures of various kinds. Fine white flour, which, at the present time, forms the bulk of that used, has been lessened very considerably in its vitamin and mineral content, by its manufacture from the grain.

3. too much protein is used. Protein is the most complex of all the nutrients of foods, involving much more work in digestion and elimination than the fats and carbohydrates; also, because the body has no means of storing surplus protein, only that which is necessary for the daily requirement should be used.

IV. Habits in regard to Food.

1. Cultivation of a normal appetite. It cannot be too strongly urged upon mothers that they cultivate in their children a liking for good, wholesome food. Very frequently a diet becomes inadequate because of a supposed dislike of some of the most necessary foods; this is true, in many cases, in regard to milk, eggs and vegetables.

2. Eating between meals should be discouraged, except in the case of those children who are underweight, invalids and those with naturally small appetites. The food eaten should be a suitably chosen lunch, and not an indiscriminate nibbling of whatever has the strongest appeal. Too much candy is eaten for health.

3. Thorough mastication of foods should become a habit in early life, in order that the organs of digestion may be assisted in their work, and in order also to promote a healthy condition of the teeth: hard food should be included in every meal. A present-day tendency which is to be deplored is that of using freshly cooked flour mixtures; these are made almost exclusively of finely milled flour, with the result that very little resistance is offered in their mastication.

4. A condition of fatigue or nervousness should always suggest a careful choice of simple, nourishing food.

5. Fads, in regard to foods, should be of little interest to the common-sense person whose first business in life is to be well.

V. Food Combinations.

1. Distribute very rich foods over a day or, better still, over several days; pork and pastry should not appear on the same dinner menu.

2. Serve concentrated foods with those more dilute; for example, meat, eggs and cheese served in the same meal result in a combination which is much too concentrated; the same is true when rich cake is served with ice cream.

3. Combine foods in which differences in texture are evident; in this point is found one of the reasons for the enjoyment of a crisp salad following the meat course at dinner; for the same reason crackers and cheese are much more interesting than bread and cheese.

4. Study pleasing combinations from the standpoint of flavor and color. Meals which have been carefully prepared and artistically served are eaten with a relish which in normal cases almost surely guarantees good digestion and a condition of fitness which nothing so much as wholesome food can produce.

ABBREVIATIONS, MEASUREMENTS AND TEMPERATURES

ABBREVIATIONS.

The writing of recipes becomes very much simplified when abbreviations are used. Those stated below have been followed consistently throughout this book:

1 teaspoon.....	1 T.
1 tablespoon.....	1 tb.
1 cup.....	1 c.
1 ounce.....	1 oz.
1 pound.....	1 lb.
1 pint.....	1 pt.
1 quart.....	1 qt.
Few grains.....	f.g.

MEASUREMENTS.

3 T.....	1 tb.
16 tb.....	1 c.
1 c. measures.....	$\frac{1}{2}$ pt.

Notes on Measuring.

1. The recipes given in this book have been tested for standard measurements only.

2. When measuring liquids, the cup should be as full as it will hold; fine, dry materials, as flour, should be sifted before measuring, then levelled with a knife. The material should not be packed down.

3. To measure 1 tb. fill the tablespoon, then level with the straight edge of a knife.

4. To measure $\frac{1}{2}$ tb. first measure 1 tb., then divide spoon in halves from handle to tip.

5. To measure $\frac{1}{3}$ tb. first measure 1 tb., then divide spoon in thirds from side to side

TABLE OF WEIGHTS AND MEASURES.

2 c.....	1 pt.	3½ c. graham flour.....	1 lb.
4 c.....	1 qt.	1¾ c. rice.....	1 lb.
2 tb. butter.....	1 oz.	5½ c. rolled oats.....	1 lb.
2 c. butter.....	1 lb.	4½ c. ground coffee.....	1 lb.
3½ tb. flour.....	1 oz.	4¾ c. tea.....	1 lb.
3½ c. flour.....	1 lb.	3½ c. cocoa.....	1 lb.
2 tb. granulated sugar.....	1 oz.	2 c. chopped meat.....	1 lb.
2 tb. fruit sugar.....	1 oz.	4 c. grated cheese.....	1 lb.
3 tb. brown sugar.....	1 oz.	8 or 9 eggs.....	1 lb.
2 c. granulated sugar.....	1 lb.	1 egg.....	about 2 tb.
2 c. fruit sugar.....	1 lb.	1 square chocolate.....	1 oz.

3¼ c. brown sugar.....	1 lb.	4 tb. granulated gelatine...	1 oz.
2½ c. cornmeal.....	1 lb.		

Note on Recipes.

In order to avoid a repetition of recipes, the individual amount for class work is placed at the left of the line in the recipe, the large amount on the right side. This arrangement of quantities may be useful to those preparing food for two or three, in which case it may be more convenient to increase the individual quantity rather than to lessen the larger amount.

TEMPERATURES.

In order to obtain a correct temperature a mercury thermometer should be used; those specially designed for the oven and confectionery are most convenient. The heat indicator on the oven door may not agree with the temperatures stated below:

(A.) WATER TEMPERATURES.

Simmering point.....	185°F.
Boiling point.....	212°F.

(B.) OVEN TEMPERATURES.

Slow oven.....	250° to 325°F.
Meringues.....	250° to 300°
Soufflés.....	275° to 325°
Custards.....	300° to 325°

MEATS

(A).—BEEF.

General Rules for Cooking Meats.

The methods for cooking meats may be divided into two general classes—"quick methods," as broiling, pan-broiling, roasting; "slow methods," as stewing, braising, pot-roasting.

"Quick methods" should be used only for tender meats: exception is made to this general rule when tough meat is finely chopped to break up the connective tissue, then cooked as tender meat.

When the cooking of tough meat is to be carried on "below boiling point," the temperature should be regulated so that the liquid around the meat does not show the breaking of bubbles on its surface. The reason for this is that when meat is cooked by boiling, the connective tissue may be so softened the meat falls apart, but at the same time the protein is hardened and made difficult of digestion.

Better results in cooking are obtained if meat is fairly thick, e.g., steaks and roasts.

Meat should be taken from the paper as soon as received. Place it on an earthenware or granite dish; cover; keep in cool place.

(F.) FISH**SELECTION OF FISH.**

Fish should be used fresh and when in season. Freezing reduces the flavor and changes the texture of the meat. Fish which has been frozen is not firm as when fresh, and breaks up easily during cooking. If necessary to use, thaw in cold water just before cooking. For baking select medium-sized fish, as salmon trout, whitefish, haddock, pickerel, or a thick piece of large fish, as cod, halibut, salmon.

For sautéing and broiling use small fish, as bass, perch, speckled trout, smelts, or steaks of larger fish, as whitefish, salmon, halibut.

For invalids, select fish which are not too rich, as whitefish, halibut, bass, trout. Broiling and baking are the best methods to be used when preparing fish for an invalid.

FRESHNESS OF FISH.

Because fish spoils quickly it is necessary that it be used fresh. The flesh should be firm, should show no discoloration and should not have strong odor. The eyes should be bright and the gills firm.

TO PREPARE FISH FOR COOKING.

1. Remove scales. Hold fish by tail; loosen scales with knife, keeping knife close against the fish, to prevent scales from flying. Fish may be scaled under water in a large pan, so that scales will not fly about. Remove fins.

2. Remove head and tail. These are sometimes left on if fish is to be baked, also in case of small fish, as smelts. If head is left on, remove eyes, using sharp knife or pair of scissors to loosen membrane.

3. Wash inside and out; sprinkle inside of fish with salt, then wash thoroughly with cold water; rinse and dry.

To Bone Fish

1. Clean fish; remove head, tail and fins.
2. Remove large bones near the head, then slip a sharp knife under flesh close to backbone.

3. Work the flesh from bones on one side, from head to tail, then from the other side.

4. Remove all small bones remaining.

Note.—Fish is frequently boned for broiling and when preparing it for children or invalids. It is necessary to bone whole fish when cooking on a plank.

Note.—Fish is cooked when flesh becomes flaky and separates easily from the bone. This test may be used in all methods of cooking fish.

BROILED FISH.

1. Prepare fish for cooking; if whole fish, remove bones; fish steaks may be boned or not.

2. If fish is dry, as whitefish, brush over with melted butter; season with salt and pepper. Rich fish, as mackerel and salmon, do not require butter.

3. Heat and grease a broiler; put in the fish.

4. Sear flesh side first; cook with moderate heat, turning 3 or 4 times. Time required about 6 to 10 mins., depending upon thickness of fish.

5. Serve garnished with parsley, lemon and potato roses.

STEAMED FISH.

1. Prepare fish for cooking; place on plate.

4. Drain; garnish with lemon and parsley or watercress; serve with Hollandaise or Sauce Tartare.

NOTES

CHAPTER IV.

VEGETABLES

The methods suitable for the cooking of vegetables are (1) baking (2) steaming and (3) boiling. Of these, steaming and baking are the best methods from the standpoint of conservation of food constituents, particularly mineral salts, of which a very large proportion is dissolved when vegetables are boiled. For this reason, the water in which vegetables are cooked, "vegetable stock," should be used in making sauces and soups.

METHODS OF COOKING VEGETABLES

I. Baking.—As this method is applicable to comparatively few vegetables, rules will be given in case of such vegetables as may be baked, as potatoes, squash.

II. Steaming.—This method should be used whenever possible. A longer time is required than when vegetables are cooked by boiling, but the losses are reduced to a minimum. In the case of strong vegetables, the flavor is sufficiently reduced.

To steam vegetables, place on plate or cheesecloth in steamer; sprinkle mild-flavored vegetables with salt; add salt to strong-juiced when half-cooked; cover with cheesecloth. Steam until tender.

III. Cooking in Water.—Vegetables are divided into three classes from the standpoint of cooking in water.

1. Mild-flavored vegetables.—Prepare the vegetables for cooking; put into boiling water to cover; bring quickly to boiling point; boil gently until tender—test with fork or knitting needle. Add salt (1 T. to 1 qt.) when vegetables are half cooked. Drain as soon as cooked.

2. Strong-flavored Vegetables.—Prepare vegetables; put into large amount boiling water; cook uncovered; change

water at end of 10 mins.; add salt when vegetables are half-cooked. If very strong (as onions) change water at end of 5 mins., and again at end of 10 mins.

3. Watery Vegetables.—Prepare vegetables (as spinach, tomatoes); place in kettle over gentle heat; heat gradually until water is extracted; cook until tender. Uncover, if necessary, to evaporate water.

EGGS

GENERAL NOTES.

1. Eggs should be kept in a cool place.
2. They should be washed before using.
3. When breaking, scrape out the white adhering to the end of shell.
4. An unbroken yolk will not harden if covered with cold water. White of egg may be kept covered in a cool place.
5. The temperature used in cooking eggs and egg mixtures is important. Eggs are "cooked" when they are firm or coagulated; this change is completed at 162°F.; that is, boiling point is not required for the cooking of eggs. A temperature above that at which eggs coagulate toughens, hardens and shrinks the proteins of the egg and renders them less easy of digestion.

SOFT-COOKED EGGS.

1. Boil water—a pint for 1 or 2 eggs; $\frac{1}{2}$ c. extra for each additional egg.
2. Set back where water will keep hot; put in eggs, cover.
3. Let stand 4 to 6 mins. for one or two eggs; 5 to 8 mins. for several.

HARD-COOKED EGGS.

Method I.

1. Boil water—1 pint for 1 or 2 eggs; 1 c. extra for each additional egg.

SALADS

GENERAL RULES

1. Ingredients should be thoroughly chilled.
 2. Salad plants and green vegetables should be clean, crisp and dry.
 3. Ingredients should be cut in attractive shapes and in suitable sizes. If too large, they are not seasoned with the dressing, and if too small, are apt to break up and become compact.
 4. Add enough dressing to season well, but not enough to make the salad too moist.
 5. With the exception of parsley, serve garnishes such as may be eaten with the salad.
 6. As a rule a better flavor results when foods are marinated with dressing and allowed to stand at least one hour before serving.
 7. When more than one food is used, marinate separately; let stand to season, then combine just before serving.
 8. If an oil dressing is used, a good flavor may be obtained by marinating the salad ingredients with French dressing; let stand to season; then use boiled dressing or mayonnaise, as desired, in combining the salad. This applies particularly to cooked vegetables, meat and fish.
- Salad Greens are such vegetables as lettuce, watercress, garden cress, endive, chicory.

PREPARATION OF GREENS.

1. To freshen, place in cold water one to two hours, before using. If very wilted, add a few drops of vinegar to the water.
2. Wash carefully in plenty of cold water, being careful that no insects are left on the leaves.
3. Dry thoroughly by placing in or between towels and shaking gently.
4. To keep greens fresh, place in a damp cloth in refrigerator or place in a covered dish in a cold place.

GARNISHES.

1. Never garnish elaborately.
2. Whenever possible, use one of the ingredients of the salad in garnishing.
3. The appearance of almost all salads is improved by a careful arrangement on a bed of head lettuce or shredded leaves. Watercress and endive may also be used.
4. To make "curled celery," cut the celery stalk into small $2\frac{1}{2}$ " strips. Slash from each end of the strip to within $\frac{1}{2}$ " of the centre. Place in cold salted water to curl.
5. To make "radish roses," cut radish into six or eight sections to within one quarter inch of the bottom; leave stem and leaf on, place in cold water to open.

As foods cooked in fat (*sautéd* or fried) so often are unwholesome because of the absorption of fat, special precautions should be followed.

GENERAL RULES

I. *Choice of Fat*.—It is necessary to use a soft fat which will drain from the food before cooling; use lard or one-half lard and one-half suet; or a lard substitute; clarified beef dripping; a good cooking oil, as olive oil or mazola.

II. *Temperature of Fat*.—Use a thermometer or test with a small cube of bread; count the time required to brown the bread.

(a) For food already cooked and for oysters the bread should brown in 40 secs.,—390°F.

(b) For uncooked foods, the bread should brown in 60 secs.,—365°F.

III. *Care of Fat*.—After using, cool the fat a little, strain through cheesecloth; cover when cold and keep in a cool place. It should be possible to use the fat several times. To clarify fat—cook several slices of raw potato in the fat until crisp and fat is still; cool and strain.

IV. *Preparation of Food*.—It is necessary that a crust form on the outside of the food to prevent fat being absorbed. Therefore, the food should contain egg or should be coated with crumbs and egg or a batter. Lower the food into the kettle with a wire egg-beater or use a frying basket. When cooked, lift out; drain on unglazed paper in warming oven.

V. *Rendering of Fat*.—Cut fat into pieces, discarding coarse skin; put into kettle, cover with cold water; heat

slowly uncovered; when water is nearly all evaporated, reduce the heat; when skin is shrivelled and the fat is still, drain through a double cheesecloth; cool, cover, keep in a cold place.

VI. *Preparation of Crumbs.*—Dry pieces of stale bread in warming oven until crisp; put through meat chopper or roll fine; sift.

CHAPTER XIV

CANNING, JELLY-MAKING AND PICKLING

CANNING

Canning is the process by which foods are sterilized and sealed in air-tight cans or jars, for use when not in season. No preservatives, as sugar, salt, vinegar, etc., are required; if used, only enough for flavor is necessary. For this reason special precautions must be followed to ensure success.

Preparation of Jars

1. Test for leakage—put a little water in jar; fit with rubber ring, glass and screw top; invert; if water leaks from jar, it is not air-tight and should be refitted.
2. Wash jars in hot, soapy water; rinse.
3. Sterilize jars, glass and screw tops—place on rack in kettle or boiler, cover with cold water, heat gradually to boiling; boil 20 mins., lift out, drain and fill at once.
4. Sterilize rubber rings by dipping three or four times into boiling water; it is wise to use only rings which are new or nearly so.

Selection of Fruit and Vegetables

Select those which are sound and firm, just ripe or slightly under-ripe rather than over-ripe, uniform and medium in size.

Preparation of Fruit and Vegetables

1. Pick over; wash thoroughly in cold water (exc. raspberries); drain in a colander.
2. Prepare, for cooking, according to kind of fruit—
Strawberries—remove hulls.

Currants and gooseberries—remove stems and blossom.

Peaches and apricots—blanch, peel, cut in halves, remove stones.

Plums—remove stems; prick with a fork in several places.

Cherries—removes stems and pits.

Pears and quinces—quarter, core, peel; drop into cold water.

Grapes—remove from stems, separate pulp from skins; cook pulp and strain out seeds.

For preparation of vegetables, see table on cooking of vegetables, p. 94.

Blanching of Fruits and Vegetables

Place in cheesecloth or wire basket; dip into boiling water (the time varies with the kind of fruit or vegetable), then plunge into cold water.

Blanching is done

1. to reduce the bulk, as in spinach.
2. to set the color, as in peas and beans.
3. to reduce strong flavor, as in cauliflower.
4. to loosen the skins, as in peaches.

The cold plunge, after scalding, shrinks and makes the food firm.

Methods of Canning

COLD-PACK METHOD

1. Pack the fruit or vegetables in sterilized jars.
2. Fill with hot liquid (syrup or water).
3. Cover with glass top, screw metal ring loosely. If tightly sealed, jars will break.
4. Steam until tender.
5. Lift jars out, remove top, adjust rubber ring.
6. Press food with silver knife to allow air to escape.
7. Fill to overflowing with boiling syrup or water.
8. Seal at once; wipe jar; invert till cold.

Note.—Some fruits, as plums, hard pears, may be steamed 15 to 20 mins. before adding syrup. This softens the skins and fruit, which might otherwise be tough.

OPEN KETTLE METHOD.

1. Have syrup boiling in a broad kettle.
2. Add fruit; cook gently, stirring as little as possible. until fruit is tender; remove scum.

3. Fill sterilized jars to overflowing.

4. Seal at once; wipe off and invert till cold.

Note.—If too large an amount is cooked at one time, the food, especially small fruit, is broken up before it can be uniformly cooked.

Vegetables, except tomatoes, are more successfully canned by the cold-pack method than in the open kettle.

SYRUPS FOR CANNED FRUIT.

1. For sweet fruits—1 c. sugar to 2 c. water.
2. For medium fruits—1 c. sugar to 1 c. water.
3. For acid fruits—2 c. sugar to 1 c. water.

Add boiling water to sugar; stir till dissolved. Boil 5 to 10 mins.; remove scum.

Note.—In order to calculate the amount of syrup required, weigh the fruit and allow $\frac{1}{3}$ to $\frac{1}{2}$ lb. sugar to 1 lb. fruit for sweet and medium fruits and $\frac{3}{4}$ lb. sugar to 1 lb. fruit for acid fruits and those desired very rich.

CANNED PEACHES.

1. Scald fruit $1\frac{1}{2}$ mins., then cold dip.
2. Remove skins; cut in halves, remove stones.
3. Pack carefully in sterile jars; add syrup.
4. Cover with glass top and metal ring, screwed loosely.
5. Steam 15 to 25 mins., according to size and ripeness of fruit.
6. Lift out, put on rubber ring; fill to overflowing with boiling syrup; seal at once.

CANNED PLUMS.

Use method for canned peaches; if plums are very firm, they should be steamed 15 to 20 mins. before syrup is added. Prick plums before cooking so that syrup is absorbed.

CANNED PEARS.

1. Wipe pears, cut in halves, core and peel.
 2. Pack in sterile jars; steam 10 to 15 mins.; longer, if pears are very hard.
 3. Add pieces of stick cinnamon, ginger or cloves.
 4. Fill jar with syrup; steam until fruit is tender; seal.
- Note.*—For lemon flavor, cook thin pieces of lemon rind in syrup; strain out before adding syrup to fruit or add 1 tb. lemon juice to syrup for 1 qt. jar.

CANNED BEANS.

1. Select very tender beans; remove strings and tips; cut, as desired.
2. Blanch 5 mins., then cold dip.

5. Fill jars with water which has been boiled and cooled.
6. Adjust tops; steam 2 hours for 1 pint jar—3 hours for 1 quart.
7. Put on sterilized rubbers; fill jars to overflowing with boiling water; seal.

CANNED BEETS.

1. Wash small beets, leaving on roots and 2 inches of stem.
2. Boil 20 mins.; drain; cold dip.

4. Pack in sterile jars; add 1 T. salt and 1 to 2 tb. vinegar to 1 qt. jar.
5. Fill jar with water which has been boiled and cooled.
6. Cover; steam 1 to 1½ hours; fill and seal.

CANNED CORN.

1. Select tender, fresh corn; remove husks and silk.

3. Cut from cob; put into preserving kettle.

5. Boil gently 15 mins.; fill sterile jars, cover, steam 1½ hours for pint jars, 2½ hours for quart jars.
6. Fill to overflowing with boiling water; seal.

CANNED TOMATOES.

1. Select firm, ripe tomatoes; scald 2 mins., then cold dip.
2. Remove skins and core; cut into pieces.
3. Put into preserving kettle; heat gradually to boiling, stirring frequently.

CANNED WHOLE TOMATOES.

1. Select firm tomatoes of medium or small size.
2. Scald and cold dip; remove skins and cores.
3. Pack in sterile jars; fill with water which has been boiled and cooled.

6. When blended, add strained tomato, slowly.
7. Heat to boiling; cook until thickened.
8. Seal in sterile jars.

JELLIES, JAMS AND PRESERVES

Success in the making of jellies and jams depends to a great extent upon a proper selection of fruit. Use fruits which are acid and just ripe or slightly under ripe; under these conditions, the jelly-making principle, "pectin," is in its best state for setting the jelly.

Pectin is richest in currants, grapes, lemons, sour and bitter oranges, crab apples, tart apples, cranberries.

Preparation of Fruit

1. Large fruit, as apples—wash, cut in pieces, add water to cover, cook till soft.

2. Small fruit, as grapes, currants—wash, pick from stems, put into kettle; break up with potato masher, cook till soft.

Preparation of Fruit Juice

1. When fruit is very soft, pour it into jelly-bag which has been scalded.

2. Drip several hours; the bag may be squeezed for a second quality of juice, which should be kept separate from the first.

Test for Pectin

1. Heat juice to boiling point and boil gently 10 to 20 mins.; grape and currant juices require less boiling than juice of large fruits.

2. Add 1 T. alcohol to 1 T. fruit juice; mix and let stand 3 mins. If sufficient pectin is present to form a jelly, it can be gathered in a thick mass from this mixture. If very little pectin can be collected, the juice should be given longer boiling and tested again.

Addition of Sugar

1. As a rule, $\frac{3}{4}$ c. sugar to 1 c. juice is sufficient; more than this makes a jelly which is too sweet in flavor; also the

sugar is apt to crystallize out on standing. When the juice is quite acid, as from very tart or unripe grapes, bitter oranges, 1 c. sugar to 1 c. juice may be required.

2. When the juice contains sufficient pectin by test, add the sugar, which may be heated.

3. Stir until sugar is dissolved; heat to boiling.

Cooking and Testing of Syrup

1. Boil syrup gently, remove scum; the time necessary for cooking varies,—for acid fruits with much pectin as currants and grapes, about 8 to 10 mins.—for less acid fruits, as apples, about 15 to 20 mins. If cooked too long, the jelly will be strong in flavor and tough.

2. Test by placing a drop of syrup on a cold plate,—it holds its shape when jelly is ready for bottling.

CHAPTER XVI

FLOUR MIXTURES

(A). QUICK BREADS

General Rules

In recipes for quick breads, cakes and pastries, the proportions given are for pastry flour. If bread flour is used, substitute $\frac{7}{8}$ c. for 1 c. pastry flour. In all cases, flour should be sifted before measuring.

Flour mixtures, before cooking, may be divided into two general classes, "batters" and "doughs," the consistency depending upon the proportions of liquid to dry ingredients, as follows:

1. **Thin or pour batters**, as pop-overs, griddle cakes, in which the proportion is 1 part liquid or more to 1 part flour.
2. **Thick or drop batters**, as muffins, cakes—proportion about 1 part liquid to 2 parts flour.
3. **Soft doughs**, as tea-biscuit, bread—proportion about 1 part liquid to 3 parts flour.
4. **Stiff doughs**, as pastry, cookies—proportion about 1 part liquid to 4 parts flour.

Note.—The "liquid" includes those ingredients which are in liquid form during mixing, as milk, water, molasses, egg. An egg may be considered as a scant one-quarter cup.

Use of Leavening Agents

1. Use 2 T. baking powder to 1 c. flour.
2. If egg is used in lightening, as in muffins and cakes, reduce the baking powder by $\frac{1}{2}$ T. for each egg.
3. If baking soda and sour milk are used, use $\frac{1}{4}$ T. soda to 1 c. sour milk, and in addition use 1. T. baking powder to 1 c. flour.

4. If baking soda and cream of tartar are used, use $\frac{1}{2}$ T. soda and 1 T. cream of tartar to 1 c. flour.

5. If baking soda and molasses are used, use $\frac{1}{2}$ T. soda to 1 c. molasses.

Kinds of Shortenings

1. For tea biscuit and muffin mixtures, use butter, a butter substitute, butter and lard mixed, a lard substitute or dripping—beef or beef and pork mixed.

2. For cakes, use butter or a good butter substitute.

3. If cream is used, the butter should be reduced.

1 c. 16% cream = 3 tb. fat + $\frac{7}{8}$ c. milk.

1 c. 24% cream = $4\frac{2}{3}$ tb. fat + $\frac{2}{3}$ c. milk.

B. YEAST MIXTURES

BREAD, ROLLS AND BUNS

In all bread mixtures, it is necessary to use either bread flour, a household flour or Graham flour. Pastry flour does not contain sufficient gluten to give satisfactory results.

The yeast may be compressed, as Fleischman's, dried, as Royal, or home-made yeast. The amount used varies with the length of time of rising. The liquid may be water, potato water, milk or milk and water. Water should be boiled and cooled to lukewarm; milk should be scalded. For potato water cook 2 medium potatoes in 1 qt. water; when soft, press through a ricer and add to water in which potatoes were cooked.

A temperature of about 80°F. is best for yeast mixtures during rising.

E. PASTRY

Pastry may be divided into two general classes—*plain pastry* and *puff pastry*. The difference depends upon the kind and amount of fat used and the method of mixing and rolling.

Pastry should be light, flaky and tender.

Materials for Pastry

1. Pastry flour should be used; sift before measuring.
2. The fat, for plain pastry, may be lard or a lard substitute, butter or a butter substitute, beef dripping; for puff pastry, butter is necessary.

Essential Points in the Making of Pastry

1. All materials must be cold.
2. Mixing and rolling should be done in a cool room.
3. Pastry is more easily handled and results are improved, if dough is thoroughly chilled before rolling out.
4. Folding should be done so that air is enclosed, otherwise pastry is made tough by much handling.
5. A hot oven is necessary in order to cause a sudden expansion of the air enclosed.

Temperature—450° to 500°F.

PLAIN PASTRY I.

4 tb.	1½ c. flour.
f.g.	⅓ T. salt.
1⅓ tb.	½ c. fat.
About 1 tb.	Cold water.

1. Sift flour and salt.
2. Cut in one-half the fat.
3. Add cold water to make a stiff dough.
4. Roll in rectangular sheet, ⅛" thick.
5. Place remaining fat in small pieces on half of the sheet.
6. Sprinkle lightly with flour.
7. Fold; press edges down so that air is enclosed.
8. Roll lightly, fold, roll again.

Note.—Very little flour should be needed on board for rolling; if pastry sticks, the dough has been made too soft in mixing or has become too warm. If chilled it will roll more easily.

This amount will make 2 shells.

PLAIN PASTRY II.

4 tb.	1 c. flour.
f.g.	¼ T. salt.
1 tb.	¼ c. fat.
Water.	Cold water.

1. Sift flour and salt.
2. Cut in the fat, using a cake cutter.
3. Take out one-quarter of the mixture.
4. Add cold water to remainder to make a stiff dough.
5. Roll out in rectangular sheet, ⅛" thick.

6. Spread one-half of sheet with half of the reserved flour and fat.

7. Fold; press edges together; roll out.

8. Spread with remaining fat and flour; fold and roll out.

Note.—For those not expert in pastry making, this method may be more satisfactory than the first. Pastry II should be very tender but is not as flaky as Pastry I.

PASTRY SHELLS FOR PIES.

1. Make plain pastry; roll out $\frac{1}{8}$ " thick.

2. Place on outside of shallow pie plate.

3. Prick dough in a number of places with a fork so that shell may keep its shape.

Through the courtesy of the Dietetic Department of Christie St. Hospital, Toronto, the following recipes are being printed in this volume.

A brief explanation may be necessary regarding the special ingredients used.

Saccharin is a sugar substitute because of its very sweet flavor; it has no food value. When saccharin is used continuously the flavor becomes distasteful, which in almost every case provides a guarantee against its over-use.

Cellu Flour is a cellulose product, having no food value.

Diaprotein is a self-rising flour, specially prepared from the casein of milk. It contains no carbohydrate. Following is its chemical analysis:

Starch.....	0.00%
Sugar.....	0.00%
Protein.....	83.01%
Mineral Salts.....	2.81%
Milk fat.....	3.46%
Water.....	6.72%
Leavening.....	4.00%

India Gum is used in binding diabetic flour mixtures: it has no food value.

Mineral Oil (paraffin oil) is a petroleum product having no food value.

Agar-agar is a vegetable gelatine of no food value.

VENISON.

Cuts of venison are similar to those of mutton. The best cuts for roasting are the leg, or haunch, and the saddle. Steaks and cutlets are slices from the leg and loin. Other pieces, as the flank, breast and neck, should be used in stews. The flank is sometimes included with the saddle, in which case, a few pieces of celery or celery and carrot may be rolled in each flank, which is then skewered underneath, close to the backbone. Venison, when roasted or broiled, is usually served rare.
